

About Cellulite

Almost all women have cellulite. In fact, cellulite plagues more than 80% of the adult female population. By 2007, cellulite reduction and body contouring sessions are projected to be a massive \$3.5 billion dollar market with over 9 million procedures performed annually.

There are many causes for cellulite including diet, exercise, genetic predisposition, and inevitable lifetime hormone changes. These factors cause the fat cells in the subcutaneous fat layer to enlarge and stick together inside the pockets in which they are enclosed. The pockets are stretched upward while the fibers between the pockets are strained. Circulation may be inhibited, and toxins and water can be trapped. The result is cellulite.

Cellulite may not respond well to weight loss, exercise, or creams. However, a new technology called Dermalsonic® is delivering results. Many patients say they can see improvements after only one session.

Dermalsonic® programs are clinically tested for efficacy and are administered by trained therapists.

The Dermosonic® Advantage

Dermosonic is a patented technology to temporarily yet effectively reduce the appearance of cellulite, temporarily increase circulation and relieve minor muscle aches and pains while relaxing muscle spasms. The Dermosonic Method is a comprehensive, non-surgical approach. Dermosonic embraces the physical and aesthetic needs of the whole body using a patented technique that has been proven safe and effective. Other systems rely on vigorous suction and rolling which can be uncomfortable for some patients. Some systems require the patient to wear a body stocking to prevent potential pinching and bruising. With Dermosonic, no body stocking is needed. Treatments are enjoyable and relaxing because the skin is warmed and soothed by ultrasound and gently massaged with NIST™.

How Dermosonic® works

Dermosonic combines ultrasound and (NIST) vacuum pressure massage on the surface of the skin to temporarily reduce the appearance of cellulite.

Ultrasound

Ultrasound is applied to gently warm the underlying layers of the epidermis and dermis, preparing the tissue for the benefits of NIST. Ultrasound can be pulsed continuously or intermittently.

N.I.S.T. Non-Invasive Subdermal Therapy

NIST or Vacuum Suction mobilizes the warmed connective tissue and temporarily improves blood circulation. Dermosonic closes the gap between the two forces that originally created the dimpled appearance, thus temporarily reducing the appearance of cellulite.

How do treatments feel?

Dermosonic® does not pinch, roll or bruise the skin so the processes are not only pain free, they feel good.

How many treatments are needed?

Depending on your needs, age and lifestyle, treatments are recommended one to two times per week for a total of 8-12 treatments. Follow-up treatments are recommended every 6 to 8 weeks.
